ABOUT US

Founded in December 2019, Exocet Polytechnique brings together around forty engineering students who share a common passion for innovation and sustainable development in the maritime field.

The year 2024-2025 marks a turning point for the team: exceptional recruitment, increased diversity, and a renewed spirit of collaboration allow Exocet to aim even higher. Our mission: to innovate, raise awareness, and inspire the next generation of engineers to build a sustainable maritime future.

OUR PROJECT

Our prototype is a single-seat hydrogen-powered catamaran designed to push the boundaries of clean maritime propulsion. Powered by a fully electric energy system fueled by hydrogen, the vessel embodies our commitment to innovation and sustainability. Stored safely on board, hydrogen supplies PEM (Proton Exchange Membrane) fuel cells, which generate electricity through an electrochemical reaction with ambient oxygen. This process produces clean electrical energy to power a high-performance electric motor, enabling silent navigation with zero greenhouse gas emissions at the point of use. Exocet is proud to be one of the only North American teams competing in the Monaco Energy Boat Challenge with hydrogen-based technology, positioning us at the forefront of next-generation sustainable maritime innovation.

MONACO ENERGY BOAT CHALLENGE

The Monaco Energy Boat Challenge brings together the world's best student teams each year to participate in a regatta of carbon-neutral marine prototypes.

The challenge for participating teams is to design and build a cockpit that attaches to 6 meter long hulls and to develop the most powerful and durable propulsion and power system possible.

Teams are also required to present Tech Talks (technical presentations) and a complete life cycle analysis of their prototype. They then showcase their innovations to other participants and industry professionals.

AMBITIONS ET ACCOMPLISHMENTS

Our last two participations in the Monaco Energy Boat Challenge earned us three awards and established us as the top North American team. We are extremely proud to have competed against the world-class international field that defines this competition. This year, we are setting our ambitions even higher.

Over the past three years, the team has successfully completed a full transition from all-electric propulsion to 100% hydrogen propulsion. This major technological shift required substantial resources and specialized equipment, leaving limited time for system optimization.

For the 2024-2025 season, our objective is to optimize and redesign several key systems to significantly enhance our performance and achieve even stronger results at the competition in the summer of 2026.

ENVIRONMENTAL GOALS

In an era where the maritime industry accounts for nearly 90% of global trade, it remains one of the major contributors to air pollution. Although maritime transport is the most energy-efficient mode of large-scale transportation, it still generates significant air and water pollution and increases the risk of oil spills.

One of the primary objectives of the Monaco Energy Boat Challenge is to reduce the environmental footprint of global maritime transport. A dedicated award recognizes the most innovative project in terms of environmental sustainability. In this context, we will conduct a comprehensive Life Cycle Assessment (LCA) of our prototype, covering every stage from energy and material production to the end-of-life phase of the project. This analysis will enable us to identify the main sources of emissions and environmental impact, allowing us to implement targeted improvements in the following year.

With environmental responsibility at the core of our mission, we have created a new position: Head of Sustainable Development Analysis and Eco-Design. This role is responsible for evaluating the environmental impact of both the prototype and its manufacturing processes, ensuring that sustainability principles guide every stage of development.

TECHNICAL SUMMARY

2024-2025

In 2024-2025, the team designed a **new version** of its hydrogen prototype, focusing on three key areas: structure, energy, and electronics. This redesign aims for improved performance, reliability, and modularity.

Structure: Development of a lighter aluminum structure, integration of a fiberglass cockpit, restoration of worn hulls, and implementation of an improved steering system.

Energy: Establishment of a strategic partnership with the Institut de recherche sur l'hydrogène (IRH), along with the integration of a high-power electrical system combining batteries and hydrogen fuel cells.

Electronics: Implementation of a faster onboard communication network, custom PCB design, and adoption of the Rust programming language for enhanced performance and reliability.

Budget 2025-2026

Design	50 000
Manufacturing	16 380
Tests	30 300
Events	7 815
Competition	34 550
Administration fees	5 810
Total	144 855\$

WHY BECOME A PARTNER

Investing in Exocet is not simply a financial contribution, it is a strategic commitment to the future of sustainable maritime innovation. By supporting our team and our participation in the Monaco Energy Boat Challenge, you align your company with one of North America's leading student initiatives in green maritime technologies and hydrogen propulsion.

Your partnership directly fuels cutting-edge research and tangible technological advancement. Our transition to 100% hydrogen propulsion demonstrates our capacity to take on ambitious engineering challenges and deliver real innovation. Supporting Exocet means associating your brand with bold solutions to the environmental challenges facing the maritime industry.

Exocet is also a powerful recruitment pipeline. Our members are high-performing engineering students specializing in advanced technologies such as hydrogen systems, high-power electrical integration, and embedded electronics. They are not only future engineers, they are future industry leaders. By partnering with us, you gain early access to top-tier talent and position your organization at the forefront of their professional journey.

Moreover, today's students are tomorrow's decision-makers. The engineers and managers within our team will go on to select suppliers, technologies, and strategic partners throughout their careers. Building relationships now creates long-term influence and brand loyalty.

Finally, our strong community involvement and growing local and international media presence amplify your visibility within both maritime and academic networks. Through competitions, conferences, and outreach initiatives, your brand gains meaningful exposure to a highly targeted audience committed to innovation and sustainability (see visibility plan on page 11).
